BASE ANALOGUES

5 This invention concerns base analogues which may be used to make nucleoside analogues and nucleotide analogues which may be incorporated into nucleic acids and nucleic acid analogues e.g. PNA. Some of these analogues are base-specific and may be incorporated into DNA or RNA or PNA in the place of a single native base i.e. A, T, G, or C. Other
10 analogues have the potential for base-pairing with more than one native base or base analogue.

The present invention provides a compound having the structure

15

where X = O or NH or S

Y = N or CHR⁶ or CR⁶ or CO

W = N or NR⁶ or CHR⁶ or CR⁶ or S or CO

20

n = 1 or 2 or 3

each R⁶ is independently H or alkyl or alkenyl or alkoxy or aryl or a reporter moiety,

where necessary (i.e. when Y and/or W is N or CR⁶) a double bond is present between Y and W or W and W, and

25

Q is H or a sugar or a sugar analogue, provided that

- 2 -

- i) when n is 2 and X is NH and W is CHR^6 or CR^6 , and Y is CO, then at least one reporter moiety is present,
- ii) when n is 1 and X is NH and W is N or NR^6 , then at least one reporter moiety is present,
- 5 iii) when n is 1 and X is 0 and Y is CHR^6 or CR^6 and W is CHR^6 or CR^6 , then at least one R^6 is a reporter moiety which is a reactive group or signal moiety or solid surface joined to the remainder of the molecule by a linker of at least 3 chain atoms,
- iv) when n is 1 and X is NH and Y is CHR^6 or CR^6 and W is
 10 CHR^6 or CR^6 , then at least one reporter moiety is present,
- v) when W is S, then n is 2 and W_n is $-\text{CHR}^6\text{-S-}$ or $=\text{CR}^6\text{-S-}$,
- vi) when n is 2 and X is NH and Y is CHR^6 or CR^6 , then at least one R^6 is a reporter moiety which is a reactive group or signal moiety or solid surface joined to the remainder of the molecule by a linker of at least
 15 3 chain atoms.

Q may be

20

- where Z is O, S, Se, SO, NR^8 or CH_2 ,
 R^1 , R^2 , R^3 and R^4 are the same or different and each is H, OH, F, NH_2 , N_3 , O-hydrocarbyl or a reporter moiety,
 R^5 is OH, SH or NH_2 or mono-, di- or tri-phosphate or -
 25 thiophosphate, or corresponding boranophosphate,
 or one of R^2 and R^5 is a phosphoramidite or other group for

- 3 -

incorporation in a polynucleotide chain, or a reporter moiety,
or Q consists of one of the following modified sugar
structures

5

Acyclic Sugars

R = CH₃ , CH₂OH , H ,

10

Morpholino Backbone

or Q is a nucleic acid backbone consisting of sugar-phosphate repeats or modified sugar-phosphate repeats (e.g. LNA) (Koshkin *et al*, 1998, Tetrahedron 54, 3607-30) or a backbone analogue
 5 such as peptide or polyamide nucleic acid (PNA). (Nielsen *et al*, 1991, Science 254, 1497 - 1500).

When Q is H, these compounds are base analogues. When Q is a sugar or sugar analogue or a modified sugar, these compounds are nucleotide analogues or nucleoside analogues. When Q is a nucleic acid
 10 backbone or a backbone analogue, these compounds are herein called nucleic acids or polynucleotides.

Preferred general structures covered by the invention are

In the context of this invention, a nucleotide is a naturally occurring compound comprising a heterocyclic base and a backbone
 20 including a phosphate. A nucleoside is a corresponding compound in which a backbone phosphate may or may not be present. Nucleotide analogues and nucleoside analogues are analogous compounds having different bases and/or different backbones. A nucleoside analogue is a compound which is capable of forming part of a nucleic acid (DNA or RNA
 25 or PNA) chain, and is there capable of base-pairing with a base in a

complementary chain or base stacking in the appropriate nucleic acid chain. A nucleoside analogue may be specific, by pairing with only one complementary nucleotide; or degenerate, by base pairing with more than one of the natural bases, e.g. with pyrimidines (T/C) or purines (A/G); or
5 universal, by pairing with each of the natural bases with little discrimination; or it may pair with another analogue or itself.

In one preferred aspect of the invention, the base analogue is linked to a sugar moiety such as ribose or deoxyribose to form a nucleoside analogue. When the group R^5 is triphosphate, the nucleoside
10 triphosphate analogues of the invention are capable of being incorporated by enzymatic means into nucleic acid chains.

Preferably n is 1 or 2, and W is N or NR^6 or CR^6 or CHR^6 .

In another preferred aspect, the nucleoside analogue or nucleotide analogue which contains a base analogue as defined is labelled
15 with at least one reporter moiety. A reporter moiety may be any one of various things. It may be a radioisotope by means of which the nucleoside analogue is rendered easily detectable, for example $^{32}\text{-P}$ or $^{33}\text{-P}$ or $^{35}\text{-S}$ incorporated in a phosphate or thiophosphate or phosphoramidite or H-phosphonate group, or alternatively $^3\text{-H}$ or $^{14}\text{-C}$ or an iodine isotope. It
20 may be an isotope detectable by mass spectrometry or NMR. It may be a signal moiety e.g. an enzyme, hapten, fluorophore, chromophore, chemiluminescent group, Raman label or electrochemical label. The reporter moiety may comprise a signal moiety and a linker group joining it to the remainder of the molecule, which linker group may be a chain of up
25 to 30 carbon, nitrogen, oxygen and sulphur atoms, rigid or flexible, unsaturated or saturated as well known in the field. The reporter moiety may comprise a solid surface and a linker group joining it to the rest of the molecule. Linkage to a solid surface enables the use of nucleic acid fragments containing nucleoside analogues to be used in assays including
30 bead based probe assays or assays involving arrays of nucleic acid

samples or oligonucleotides which are interrogated with e.g. oligonucleotide or nucleic acid or even peptide or protein probes. The reporter moiety may consist of a linker group with a terminal or other reactive group, e.g. NH_2 , OH , COOH , CONH_2 or SH , by which a signal moiety and/or solid surface may be attached, before or after incorporation of the nucleoside analogue in a nucleic acid chain.

To avoid risk of steric hindrance, a linker preferably has at least three chain atoms, e.g. $-(\text{CH}_2)_n-$ where n is at least 3.

Two (or more) reporter moieties may be present, e.g. a signal moiety and a solid surface, or a hapten and a different signal moiety, or two fluorescent signal groups to act as donor and acceptor. Various formats of these arrangements may be useful for separation or detection purposes.

Purine and pyrimidine nucleoside derivatives labelled with reporter moieties are well known and well described in the literature. Labelled nucleoside derivatives have the advantage of being readily detectable during sequencing or other molecular biology techniques.

R^1 , R^2 , R^3 and R^4 may each be H , OH , F , NH_2 , N_3 , O-alkyl or a reporter moiety. Thus ribonucleosides, and deoxyribonucleosides and dideoxyribonucleosides are envisaged together with other nucleoside analogues. These sugar substituents may contain a reporter moiety in addition to any that might be present on the base.

R^5 is OH , SH , NH_2 or mono-, di- or tri-phosphate or -thiophosphate or corresponding boranophosphate. Alternatively, one of R^2 and R^5 may be a phosphoramidite or H-phosphonate or methylphosphonate or phosphorothioate or amide, or an appropriate linkage to a solid surface e.g. hemisuccinate controlled pore glass, or other group for incorporation, generally by chemical means, in a polynucleotide chain. The use of phosphoramidites and related derivatives in synthesising oligonucleotides is well known and described in the literature.

In the new base or nucleoside analogues to which this invention is directed, at least one reporter moiety is preferably present in the base analogue or in the sugar moiety or a phosphate group. Reporter moieties may be introduced into the sugar moiety of a nucleoside analogue
5 by literature methods (e.g. J. Chem. Soc. Chem. Commun. 1990, 1547-8; J. Med. Chem., 1988, 31. 2040-8). Reporters in the form of isotopic labels may be introduced into phosphate groups by literature methods (Analytical Biochemistry, 214, 338-340, 1993; WO 95/15395).

Nucleoside analogues of this invention are useful for labelling
10 DNA or RNA or for incorporating in oligonucleotides or PNA. A reporter moiety is attached at a position where it does not have a significant detrimental effect on the physical or biochemical properties of the nucleoside analogue, in particular its ability to be incorporated in single stranded or double stranded nucleic acid.

15 A template containing the incorporated nucleoside analogue of this invention may be suitable for copying in nucleic acid synthesis. If a reporter moiety of the incorporated nucleoside analogue consists of a linker group, then a signal moiety can be introduced into the incorporated nucleoside analogue by being attached through a terminal or other reactive
20 group of the linker group.

A nucleoside analogue triphosphate of this invention may be incorporated by enzymes such as terminal transferase to extend the 3' end of nucleic acid chains in a non-template directed manner. Tails of the nucleoside analogue triphosphate produced in this way may be detected
25 directly in the absence of any reporter label by use of antibodies directed against the nucleoside analogue. The analogues when incorporated into oligonucleotides or nucleic acids may be acted upon by nucleic acid modification enzymes such as ligases or restriction endonucleases.

In primer walking sequencing, a primer/template complex is
30 extended with a polymerase and chain terminated to generate a nested set

of fragments where the sequence is read after electrophoresis and detection (radioactive or fluorescent) or directly in a mass spectrometer. A second primer is then synthesised using the sequence information near to the end of the sequence obtained from the first primer. This second
5 ("walking") primer is then used for sequencing the same template. Primer walking sequencing is more efficient in terms of generating less redundant sequence information than the alternative "shot gun" approach.

The main disadvantage with primer walking is the need to synthesise a primer after each round of sequencing. Cycle sequencing
10 requires primers that have annealing temperatures near to the optimal temperature for the polymerase used for the cycle sequencing. Primers between 18 and 24 residues long are generally used for cycle sequencing. The size of a presynthesised walking primer set required has made primer walking cycle sequencing an impractical proposition. The use of base
15 analogues that are degenerate or universal addresses this problem. The use of such analogues that are also labelled, e.g. the nucleoside analogues of this invention will also help to overcome the problem. Preferred reporters for this purpose are radioactive isotopes or fluorescent groups, such as are used in conventional cycle sequencing reactions.
20 Where the nucleoside analogues are base specific chain terminators they may be used in chain terminating sequencing protocols.

The final analysis step in DNA sequencing involves the use of a denaturing polyacrylamide electrophoresis gel to separate the DNA molecules by size. Electrophoretic separation based solely on size
25 requires the complete elimination of secondary structure from the DNA. For most DNA this is typically accomplished by using high concentrations of urea in the polyacrylamide matrix and running the gels at elevated temperatures. However certain sequences, for example those capable of forming "stem loop" structures retain secondary structure and, as a result,
30 display compression artefacts under standard electrophoresis conditions.

Here, adjacent bands of the sequence run at nearly the same position on the gel, "compressed" tightly together. Such loops are typically formed when a number of GC pairs are able to interact since GC pairs can form 3 hydrogen bonds compared to the 2 hydrogen bonds of AT pairs.

5 A second form of compression artefact is seen when rhodamine-labelled terminators are used and there is a G residue close to the terminus. In these cases, anomalous mobility of the DNA strand in a gel is often seen, possibly due to an interaction between the dye and the G residue.

10 Thus, compression artefacts appear to be caused whenever stable secondary structures exist in the DNA under the conditions prevailing in the gel matrix during electrophoresis. The folded structure runs faster through the gel matrix than an equivalent unfolded DNA.

 Currently, gel compression artefacts are eliminated in one of
15 two ways. One is to change to a stronger denaturing condition for the gel, for example 40% formamide with 7 M urea. The other method is to incorporate a derivative of dGTP during the synthesis of DNA. An alternative method would involve the use of a dCTP analogue which reduced the hydrogen bonding potential of the G-C base pair. The
20 nucleoside analogues of this invention may be useful in this regard.

 The nucleoside analogues of this invention can also be used in any of the existing applications which use native nucleic acid probes labelled with haptens, fluorophores or other reporter groups, for example on Southern blots, dot blots and in polyacrylamide or agarose gel based
25 methods or solution hybridization assays and other assays in microtitre plates or tubes or assays of oligonucleotides or nucleic acids such as on microchips. The probes may be detected with antibodies targeted either against haptens which are attached to the base analogues or against the base analogues themselves which would be advantageous in avoiding
30 additional chemical modification. Antibodies used in this way are normally

labelled with a detectable group such as a fluorophore or an enzyme. Fluorescent detection may also be used if the base analogue itself is fluorescent or if there is a fluorophore attached to the nucleoside analogue.

The use of the different mass of the nucleoside analogue
5 may also be used as a means of detection as well as by the addition of a specific mass tag identifier to it. Methods for the analysis and detection of specific oligonucleotides, nucleic acid fragments and oligonucleotide primer extension projects based on mass spectrometry have been reported.
(Beavis R.C., Chait B.T., US. 5,288,644, Wu K.J. *et al.* Rapid Commun.
10 Mass Spectrom. 7,142 (1993), Koster H. WO 94/16101

These methods are usually based on matrix assisted laser ionisation and desorption, time of flight (MALDITOF) mass spectrometry. They measure the total mass of an oligonucleotide or fragment and from this the sequence of the specific oligonucleotide may be able to be
15 ascertained. In some cases the mass of the oligonucleotide or fragment may not be unique for a specific sequence. This will occur when the ratio of the four natural bases, ACGT, is similar in different sequences.

For example, a simple 4 mer oligonucleotide, ACGT will have the same mass as 24 other possible mers, for example; CAGT, CATG,
20 CGTA, CTAG, CTGA etc.

With longer nucleic acid fragments it may be difficult to resolve the differences in mass between 2 fragments because of a lack of resolution in the spectrum at higher molecular weights. The incorporation of the analogues described here can be used to help identify the specific
25 oligonucleotide or nucleic acid fragment as their masses are different from those of the natural bases.

For example, the two sequences ACGT and CAGT can be identified in the presence of one another by mass spectrometry if, for example one of the natural nucleotides in one of the sequences is replaced
30 with one of the analogues described in this invention. For example, in the

oligonucleotide CAGT the T can be replaced by an analogue with little effect on a specific application, for example hybridisation or enzymatic incorporation. Yet the two sequences can be readily identified in the mass spectrometer because of the change in mass due to the introduction of the
5 analogue base.

Not only can mass modifications be made to the bases or linkers but also to the sugars or inter nucleotide linkages. For example thio sugars or phosphorothioate linkages will also result in distinctive mass changes.

10 A mixture of modifications at the base, linker, nucleoside or nucleotide either separately or together can give rise to a number of molecules with different masses which will be useful to define a specific sequence accurately by its mass, especially in multiplex nucleic acid hybridisation or sequencing applications.

15 The nucleoside analogues of the present invention with the combination of molecular diversity and increased numbers of positions where reporter groups may be added can result in a series of improved enzyme substrates.

Another preferred aspect of the invention is to incorporate the
20 nucleoside analogue triphosphate into DNA by means of a polymerase but without a reporter label for the purpose of random mutagenesis. It has been shown by Zaccolo et al, 1996, J. Mol. Biol. 255, 589-603 that when nucleotide analogues with ambivalent base pairing potential are incorporated by the PCR into DNA products, they induce the formation of
25 random mutations within the DNA products. In the above publication, the nucleotide analogue dPTP was shown to be incorporated into DNA by Taq polymerase in place of TTP and, with lower efficiency, dCTP. After 30 cycles of DNA amplification, the four transition mutations A→G, T→C, G→A and C→T were produced. The compound 8-oxodGTP was also used to
30 cause the formation of the transversion mutations A→C and T→G. The

nucleoside analogue triphosphates with ambivalent base pairing potential described within this invention may be used for a similar purpose.

RNA is an extremely versatile biological molecule.

Experimental studies by several laboratories have shown that *in vitro*
5 selection techniques can be employed to isolate short RNA molecules from RNA libraries that bind with high affinity and specificity to proteins, not normally associated with RNA binding, including a few antibodies, (Gold, Allen, Binkley, *et al*, 1993, 497-510 in The RNA World, Cold Spring Harbor Press, Cold Spring Harbor N.Y., Gold, Polisky, Unlenbeck, and Yarus,
10 1995, Annu. Rev. Biochem. 64: 763-795, Tuerk and Gold, 1990, Science 249:505-510, Joyce, 1989, Gene 82:83-87, Szostak, 1992, Trends Biochem. Sci 17:89-93, Tsai, Kenan and Keene, 1992, PNAS 89:8864-8868, Tsai, Kenan and Keene, 1992, PNAS 89:8864-8868, Doudna, Cech and Sullenger, 1995, PNAS 92:2355-2359). Some of these RNA molecules
15 have been proposed as drug candidates for the treatment of diseases like myasthenia gravis and several other auto-immune diseases.

The basic principle involves adding an RNA library to the protein or molecule of interest. Washing to remove unbound RNA. Then specifically eluting the RNA bound to the protein or other molecule of
20 interest. This eluted RNA is then reverse transcribed and amplified by PCR. The DNA is then transcribed using modified nucleotides (either 2' modifications to give nuclease resistance e.g. 2' F, 2' NH₂, 2' OCH₃ and/or C5 modified pyrimidines and/or C8 modified purines). Those molecules that are found to bind the protein or other molecule of interest are cloned
25 and sequenced to look for common ("consensus") sequences. This sequence is optimised to produce a short oligonucleotide which shows improved specific binding which may then be used as a therapeutic.

The base analogues described here, when converted to the deoxy- or ribonucleoside triphosphate or deoxy- or ribonucleoside
30 phosphoramidite, will significantly increase the molecular diversity available

for this selection process. This may lead to oligonucleotides with increased binding affinity to the target that is not available using the current building blocks.

The secondary structure of nucleic acids is also important
5 when considering ribozyme function. The base analogues of the present invention may cause the formation of secondary structures which would otherwise be unavailable using native bases or other modified nucleotide derivatives.

The hybridization binding properties of nucleic acids
10 incorporating base analogues of the present invention may have particular application in the antisense or antigene field.

The base analogues of the present invention may have properties which are different to those of the native bases and therefore are particularly suited to other important applications. In particular, the
15 interaction of these base analogues with enzymes may be extremely important *in vivo* and may result in the development of new anti-viral therapeutics or therapeutics for non-viral diseases.

A wide range of nucleoside and nucleotide analogues have been developed to form an original class of antiviral agents. Some of these
20 compounds have already been approved by the US FDA for use in the treatment of viral diseases. Examples are compounds like 3'-deoxy-3'-azidothymidine (AZT, Zidovudine) and 2',3'-dideoxy-3'-thiacytidine (3TC, Lamivudine) for the treatment of HIV infections. Other compounds like (S)-1-(3-hydroxy-2-phosphonylmethoxypropyl)cytosine (HPMPC, cidofovir), 9-
25 (2-phosphonyl-methoxyethyl)adenine (PMEA, adefovir) and (R)-9-(2-phosphonylmethoxypropyl)adenine (PMPA), the acyclic nucleoside phosphonate analogues, are in clinical trials. These compounds either act as absolute DNA chain terminators or result in termination after incorporation of consecutive molecules causing inhibition of the viral DNA
30 polymerase. It should be noted that some of these compounds are the

unnatural β -L enantiomers which show significantly decreased interaction with the host DNA polymerases compared to the viral polymerases.

One of the problems in the treatment of viral infections with nucleoside and nucleotide drugs is the ability of the virus to develop
5 resistance by a series of mutations to the viral reverse transcriptase gene that are selected as a result of drug pressure. Therefore, it is often necessary to use combination drug therapies to overcome this problem. However, the number of suitable, available compounds for therapy is limited. The subject of this invention could be useful in expanding the
10 range of nucleoside and nucleotide antiviral drugs.

Those skilled in the art of organic chemistry will recognise that there is a variety of approaches that can be taken to the compounds claimed within the scope of the claims. In addition to those approaches detailed in the experimental section those illustrated below are possible.

Scheme1

5

In order to synthesise a compound where $W=CR_8$ and R_8 contains a reporter group the reaction sequence in scheme 1 can be used.

Diacetyl protected deoxycytidine can be treated with ethyltrifluorobutyrate to get an enamine intermediate. The enamine is expected to undergo oxidative cyclization under $Pd(OAc)_2/DMA/70^\circ C$ reaction conditions (Fukuda *et al*, Bioorganic & Medicinal Chemistry Letters, 1997, 7, 1683). The ester group thus incorporated can be exploited to conjugate with a fluorescent dye, e.g. after converting to a suitable functional group such as an active ester it can be either reacted directly with an amine containing fluorescent dye or with a suitably protected diamine to extend the linker group prior to signal attachment.

10

15

When X and W both equal N the following approach in scheme 2 can be undertaken

Scheme 2

5

Treatment of the known 5-aminocytidine (Kalman and Goldman, BBRC, 1981, 102, 682) with ethylformate leads to the product (R = H).

For the 8-oxoG analogue (i.e. R = O) treatment of the initial
 10 diamine with a variety of reagents (COCl₂, carbonyl diimidazole, diphenyl carbonate) leads to the desired product.

These can be converted to its 5'-triphosphate using methods outlined in the experimental section and its 5'-dimethoxytrityl-3'-phosphoramidite by standard literature methods.

15

The introduction of a linker (R₆) to the 8-position (conventional purine numbering) can be carried out using the reactivity of this position to bromination followed by alkylation with, for example, hexane diamine.

Experimental schemes

General Procedure:

- Ion exchange (IE) HPLC was performed on a Waters analytical system
5 running under Millenium Chromatography Manager software. For analytical
IE analysis a Amersham Pharmacia Biotech μ RPC ST (C₂/C₁₈) reverse
phase column (4.6x100 mm) was used, with (method A) a gradient of 0-
25% buffer B over 30 min at a flow rate of 1 mL/min or (method B) a
gradient of 0-50% buffer B over 30 min and the same flow rate as method
10 A. Buffer A was 0.1 M TEAB and buffer B was 100% acetonitrile
TLC analysis was performed on 0.2 mm-thick precoated Merck silica gel 60
F₂₅₄ plates.
Flash silica gel chromatography was performed with 230-400 mesh 60-Å
silica from Merck.
15 ¹H NMR spectra (300 MHz) were recorded on a Varian Gemini system

Example 1.

**Synthesis of 1-(2'-deoxy-5'-triphospho-β-D-ribofuranosyl)
piperidino [2,3-d]pyrimidine-2(1H)-one (1.6)**

- 18 -

5 **3',5'-Di-O-p-toluoyl-5-iodo-2'-deoxyuridine (1.1)**

A stirred solution of 5-iodo-2'-deoxyuridine (2.45 g, 6.92 mmol) in anhydrous pyridine (50 mL) was cooled to 0°C and p-toluoyl chloride (2.29, 17.3 mmol, 2.5 eq) was slowly added. The solution was allowed to warm to room temperature, heated at 50°C for 3 hrs and then

10 stirred at room temperature overnight. The solvent was evaporated in vacuo to give a white solid mass after repeated co-evaporation with EtOH. Chloroform was added and the organic phase was washed with 0.5 M H₂SO₄ (2 x 25 mL) then water (2 x 25 mL), dried over anhydrous sodium sulfate, filtered and evaporated to dryness. The crude material was

15 crystallized at -18°C in 100 mL of a mixture MeOH/CHCl₃ 5:1 to give 3.3 g of title compound (80% yield). m.p. 193°C. ¹H d₆-DMSO δ (ppm) 2.36 and

2.38 (6H, 2 x s, 2 x Me), 2.49-2.67 (2H, m, H2', H2''), 4.44-4.58 (3H, m, H4', H5', H5''), 4.50-4.55 (1H, m, H3'), 6.21 (1H, t, J=6.7 Hz, H1'), 7.30-7.36 (m, 4H, aromatic), 7.86-7.92 (m, 4H, aromatic), 8.08 (1H, s, H6), 11.79 (1H, brs, NH). m/z (MALDI-TOF MS) 613.6 (M + Na)⁺, 629.6 (M + K)⁺, C₂₅H₂₃N₂O₇ requires 590.372.

3',5'-Di-O-*p*-toluoyl-5-N-trifluoroacetylaminopropargyl-2'-deoxyuridine (1.2)

In a three-necked flask containing 60 mL of freshly distilled DMF purged with nitrogen was added the nucleoside (1.1) (2.45 g, 4 mmol), N-propargyl trifluoroacetamide (1.81 g, 12 mmol, 3 eq), tetrakis-bis-triphenylphosphine-palladium(0) (115 mg, 0.1 mmol, 2.5% mmol), CuI (38 mg, 0.2 mmol, 5% mmol) and triethylamine (2.8 mL, 20 mmol, 5 eq). The reaction was purged with nitrogen and the solution stirred at room temperature overnight. After this time tetrakis-bis-triphenylphosphine-palladium(0) (115 mg, 0.1 mmol, 2.5% mmol), CuI (38 mg, 0.2 mmol, 5% mmol) were added and the stirring continued until TLC (EtOAc/Hexane 1:1) showed the reaction was complete (20 hrs). To the mixture solid EDTA disodium salt (0.5 g) was added, then the solvent was concentrated and diluted with 100 mL of chloroform. The solution was washed with 5% EDTA disodium salt (3 x 50 mL), water (2 x 50 mL) and brine (2 x 50 mL). The organic phase was dried over anhydrous sodium sulfate, filtered and evaporated to dryness. The crude brownish solid was purified by silica gel column chromatography (MeOH/CHCl₃ 0 -> 2%) to give 2.2 g of pure material as a yellowish solid (89% yield). The purity of the compound was assessed by analytical HPLC on RP-C18 (gradient CH₃CN/H₂O in presence of 0.1% TFA, retention time 15 min). m.p. 196-198°C with dec. ¹H-NMR (CDCl₃): δ (ppm) 2.27-2.37 (1H, m, H2'), 2.42 and 2.44 (6H, 2 x s, 2 x Me), 2.79-2.85 (1H, m, H2''), 4.17 (2H, t, J=4.6 Hz, N-CH₂), 4.61-4.76 (3H, m, H4', H5', H5''), 5.62 (1H, d, J=6.2 Hz, H3'), 6.36 (1H, dd, J=5.6 and

- 20 -

8.0 Hz, H1'), 6.97 (1H, brs, NH-CH₂), 7.20-7.30 (m, 4H, aromatic), 7.86-7.96 (m, 5H, aromatic, H6), 8.61 (1H, brs, NH). m/z (MALDI-TOF MS) 636.8 (M + Na)⁺, C₃₀H₂₆F₃N₃O₈ requires 613.547.

5 **3',5'-Di-O-*p*-toluoyl-5-N-trifluoroacetylaminopropyl-2'-deoxyuridine (1.3)**

To a solution of the nucleoside (1.2) (2 g, 3.26 mmol) in THF (130 mL), 10% Pd/C (250 mg) was added and the mixture was hydrogenated (1 atm) at room temperature with vigorous stirring. After 12
10 hrs the reaction was complete (MALDI-TOF MS indicated the saturation of the triple bond to single bond). The suspension was filtered through celite and the cake washed with MeOH. The solvent was evaporated and the residue dissolved in CHCl₃ then washed with brine. The organic layer was dried over anhydrous Na₂SO₄ then evaporated to dryness. The crude
15 material was purified by silica gel column chromatography (MeOH/CHCl₃ 0 → 2%) to give 1.85 g of pure material as a white solid (92% yield). ¹H-NMR (CDCl₃): δH (ppm) 1.50-1.59 (2H, m, CH₂CH₂CH₂), 2.05-2.14 (2H, m, 5-CH₂), 2.27-2.37 (1H, m, H2'), 2.42 and 2.44 (6H, 2 x s, 2 x Me), 2.44-2.78 (1H, m, H2''), 3.17-3.24 (2H, m, N-CH₂), 4.55 (1H, brs, H5'), 4.63-4.68
20 (1H, m, H5''), 4.81-4.86 (1H, m, H4'), 5.64 (1H, d, J=6.2 Hz, H3'), 6.36 (1H, dd, J=5.4 and 8.8 Hz, H1'), 7.20-7.30 (4H, m, aromatic), 7.37 (1H, s, H6), 7.40 (1H, brs, NH-CH₂), 7.90-7.97 (4H, m, aromatic), 8.34 (1H, brs, NH). m/z (MALDI-TOF MS) 640.7 (M + Na)⁺, 656.7 (M + K)⁺, C₃₀H₃₀F₃N₃O₈ requires 617.579.

25

1-(3',5'-Di-O-*p*-toluoyl-2'-deoxy-β-D-ribofuranosyl)-4-(1,2,4-triazolyl)-5-N-trifluoroacetylaminopropyl-1H-pyrimidin-2-one (1.4)

To 1,2,4-triazole (3 g, 43.6 mmol previously dried by repeated coevaporations with anhydrous pyridine) suspended in anhydrous
30 acetonitrile (75 mL) at 0°C, was added dropwise phosphoryl chloride (0.81

- 21 -

mL, 8.7 mmol) and the mixture was stirred for 10 min at 0°C. To this suspension freshly distilled triethylamine (7.4 mL, 52 mmol) was then added and the suspension stirred for 20 min at 0°C and for a further 10 min at room temperature under nitrogen. After this time was added dropwise a
5 solution of the nucleoside (1.3) (1.75 g, 2.91 mmol) in 40 mL of anhydrous acetonitrile and stirred at overnight at room temperature under nitrogen. The solvent was removed and the residue partitioned between chloroform (50 mL) and NaHCO₃ (2 x 30 mL), then brine (30 mL). The organic phase was dried with anhydrous sodium sulfate and then concentrated to
10 dryness. The crude material was purified by silica gel column chromatography (EtOAc/Hexane 1:1 -> 8:2) to give 0.96 g of off-white foam (50% yield). ¹H-NMR (CDCl₃): δ (ppm) 1.57-1.69 (2H, m, CH₂CH₂CH₂), 2.28-2.37 (4H, m, H2', Me), 2.45 (3H, s, Me), 2.67-2.80 (2H, m, 5-CH₂), 3.20-3.32 (3H, m, N-CH₂, H2''), 4.65-4.72 (2H, m, H5', H5''), 4.90-4.94 (1H, m, H4'), 5.65 (1H, d, J=6.1 Hz, H3'), 6.38 (1H, d, J=5.9 Hz, H1'), 6.99 (1H, brs, NH-CH₂), 7.20-7.37 (4H, m, aromatic), 7.84 (2H, d, J=8.0, Hz aromatic), 7.98 (2H, d, J=8.0, Hz aromatic), 8.11 (1H, s, H6), 8.15 (1H, s, triazole), 9.30 (1H, s, triazole). m/z (MALDI-TOF MS) 692.2 (M + Na)⁺, 708.3 (M + K)⁺, C₃₂H₃₁F₃N₆O₇ requires 668.629.

20

1-(2'-deoxy-β-D-ribofuranosyl) piperidino [2,3-d]pyrimidine-2(1H)-one (1.5)

The nucleoside (1.4) (0.9 g, 1.34 mmol) was dissolved in 30 mL of methanolic ammonia and the solution vigorously stirred at room
25 temperature. After 22 hrs stirring at room temperature a small amount of final product was detected by MALDI-TOF MS. The solvent was removed by rotary evaporation, the residue re-dissolved in MeOH and the solution refluxed for 1 hr (the formation of a new product having R_f 0.3 on TLC plate, run with MeOH/CHCl₃ 20 %, was observed). The solvent was
30 removed and the residue purified by silica gel column chromatography

- 22 -

(MeOH/CHCl₃ 0 → 20 %) to give 180 mg of pure compound as a white foam (50 % yield). ¹H-NMR (d₆-DMSO): δH (ppm) 1.67-1.72 (2H, m, CH₂CH₂CH₂), 1.90-2.07 (2H, m, H2', H2''), 2.40-2.45 (2H, m, 5-CH₂), 3.14-3.22 (2H, m, N-CH₂), 3.48-3.58 (2H, m, H5', H5''), 3.70-3.74 (1H, m, H4'), 4.17-4.21 (1H, m, H3'), 4.98 (1H, t, J=5.1 Hz, OH), 5.17 (1H, d, J=4.0 Hz, OH), 6.16 (1H, d, J=7.0 Hz, H1'), 7.57 (1H, s, H6), 7.83 (1H, brs, NH). m/z (MALDI-TOF MS) 268.8 (M + H)⁺, 290.8 (M + Na)⁺, 306.7 (M + K)⁺, C₁₂H₁₇N₃O₄ requires 267.285. UV (EtOH) λ_{max} 286 nm (e = 9.8 × 10³) and 203 nm (e = 24.0 × 10³), λ_{min} 236 nm (e = 4.9 × 10³), λ_{sh} 262 nm (e = 7.4 × 10³) and 222 nm (e = 7.1 × 10³); pH1 λ_{max} 297 nm (e = 13.9 × 10³) and 219 nm (e = 8.4 × 10³), λ_{min} 253 nm (e = 2.2 × 10³); pH12 λ_{max} 281 nm (e = 25.3 × 10³).

1-(2'-deoxy-5'-triphosphate-β-D-ribofuranosyl) piperidino[2,3-d]pyrimidine-2(1H)-one (1.6)

The nucleoside (1.5) (100 mg, 0.374 mmol) and 1,8-bis(dimethylamino)naphthalene (Proton Sponge) (120 mg, 0.561 mmol, 1.5 eq) were dissolved in 2.2 mL of trimethylphosphate (dried with 4Å molecular sieves) and the solution was cooled to -20°C. Phosphoryl chloride (70 µL, 0.748 mmol, 2 eq) was added and the mixture stirred with cooling (temperature was kept between -20 and -10°C) for 4 hrs. After this time, to the purple solution tri-n-butylammonium pyrophosphate (3.74 mL of 0.5 M solution in anhydrous DMF, 1.87 mmol, 5 eq) was added followed by tri-n-butylamine (0.37 mL, 1.57 mmol, 4.2 eq) and the mixture was stirred at -20°C for 3 mins. Then 25 mL of 0.4 M TEAB solution was added and the mixture stirred at room temperature for 10 mins. Water and TEAB were removed by rotary evaporation and to the residue diethyl ether (30 mL) was added. The solvent was decanted and the gummy residue was washed once again with 30 mL of diethyl ether. After decanting the residue was dried to give 1.7 g of a gummy crude material. The crude material

was purified by ion exchange chromatography (0-100%B over 90 min. B=0.3M triethylammonium bicarbonate, 3ml/min) then the product further purified by reverse phase separation using a Waters Sep-Pak C18 cartridge eluting with 20% acetonitrile/0.1M triethylammonium bicarbonate to give the title compound. ¹H-NMR (D₂O) δ (ppm) 1.68-1.72 (2H, m, CH₂CH₂CH₂), 2.16 (2H, m, H2',H2''), 2.45 (2H,m, 5-CH₂), 3.16 (2H, m, N-CH₂), 3.16 (2H, m, H5',H5''), 4.02 (1H, m, H4'), 4.17-4.12 (1H, m, H3'), 6.07 (1H, m, H1'), 7.60 (1H, s, H6). ³¹P-NMR (D₂O): δ (ppm) -10.46 (d), -11.62 (d), -23.33 (t)

10

1.7

15

The nucleoside (1.7) and its triphosphate derivative can be made by an analogous route by carrying out a Lindlar reduction on the nucleoside (1.2) and then repeating the synthetic steps above. The experimental for the Lindlar reduction is detailed below.

20

Dissolve 1.5 g of (1.2) in 75 mL of methanol in a Parr hydrogenation flask. With a pasteur pippete, add 5 drops of quinoline and 0.5 g of Pd/CaCO₃ (Lindlar catalyst-Aldrich)(0.3 equivalents by weight). Put the flask to a Parr

- 24 -

hydrogenation apparatus, evacuate the air with hydrogen three times using a water aspirator, regulate the hydrogen pressure to 30 psi and shake the flask overnight. The reaction is checked for completion by TLC (20% MeOH/Chloroform). When the reaction has gone to completion the catalyst
5 is filtered off, wash the filter with methanol and coevaporate the filtrate with 50 g of silica gel. The product is purified by gradient flash chromatography using the following 10, 15, 20, 25% MeOH/Chloroform which afforded 1.2 g of the required olefinic intermediate as an intermediate en route to (1.7), 70% yield.

10

Example 2.**Synthesis of 3-(2-deoxy- β -D-erythro-pentofuranosyl)-6-(butyl-4-N-2,2,2-trifluoro-acetamide)- furano[2,3-*d*]pyrimidin-2-one (2.6)**

5

**3',5'-Di-O-acetyl-5-iodo-2'-deoxyuridine (2.2)**

To 5-iodo-2'-deoxyuridine (**2.1**) (70.8 g, 200 mmol, 1 eq) in an 500 mL Erlenmeyer flask was added acetic acid (72 g, 68.7 mL, 1200 mmol, 6 eq) and acetic anhydride (51 g, 47.1 mL, 500 mmol, 2.5 eq). In a test tube at 0 °C, the catalyst for the reaction was prepared by adding HClO₄ (0.5 mL) over acetic anhydride (2 mL). Five drops of the catalyst were added into the Erlenmeyer flask at 0 °C with stirring. The reaction mixture was brought to room temperature and stirred for 4 hours where

upon a thick white precipitate formed. The Erlenmeyer flask was filled with ether and stirred vigorously for 30 minutes. The white precipitate was filtered and the white cake was washed with ether (500 mL). The product was dried in the vacuum oven overnight to afford (2.2) (90.1 g, 95%) ¹H-NMR (CDCl₃) δ (ppm) 9.40 (bs, 1 H, exchangeable, NH), 7.78 (s, 1 H, H-6), 6.18 (dd, J = 8.10 Hz, 1 H, H-1'), 5.05 (m, 1 H, H-3'), 4.07-4.25 (m, 3 H, H-4', 5'), 2.35 (m, 1 H, H-2'_b), 1.85-2.12 (m, 7 H, 2xCH₃, H-2'_a)

3',5'-Di-O-acetyl-5-(pentyn-5-Cyano)-2'-deoxyuridine (2.3)

This compound was prepared from (2.1) (4.73 g, 10 mmol, 1 eq) in a similar manner as (2.4) except the reaction mixture was stirred overnight at room temperature to afford (2.3) (3.04 g, 75%): UV (MeOH) λ_{max} 289 nm; ¹H-NMR (CDCl₃) δ 9.27 (s, 1 H, exchangeable, H-NH), 7.80 (s, 1 H, H-6), 6.30 (t, J = 6.55 Hz, 1 H, H-1'), 5.25 (m, 1 H, H-3'), 4.40 (m, 3 H, H-4', 5'), 2.60 (m, 5 H, H-2'_p, C≡CCH₂CH₂CH₂CN), 2.10 (m, 7 H, H-2'_a, 2xCH₃), 1.95 (m, 2 H, H-CH₂CH₂CH₂). This compound can be cyclised to (2.4) by refluxing with a catalytic amount of CuI and ten equivalents of triethylamine in methanol.

6-Butyronitrile-3-(3,5-Di-O-acetyl-β-D-erythro-pentofuranosyl)furano[2,3-d]pyrimidin-2-one (2.4)

Triethylamine (3.04 g, 4.2 mL, 30 mmol, 2 eq) was added to a stirred solution of (2.2) (7.1 g, 15 mmol, 1 eq), Pd[P(C₆H₅)₃]₄ (1.73 g, 1.5 mmol, 0.1 eq), CuI (0.57 g, 3 mmol, 0.2 eq) and hexynenitrile (2.79 g, 30 mmol, 2 eq) in dry DMF (50 mL) and the reaction mixture was then stirred overnight at 55 °C under an inert atmosphere. To the reaction mixture was then added the bicarbonate form of AG1 X8 resin to remove triethylammonium hydroiodide, CHELEX resin to remove metal cations and activated charcoal to remove colour. After filtration on Celite a slightly yellow solution was produced. Solvent removal under high vacuum gave a

- 27 -

dark residue which was dissolved in methanol and coevaporated with silica gel (75 g). Flash chromatography with 10% methanol/chloroform as eluant afforded **(2.3)** (3.9 g, 64%) UV (MeOH) λ_{\max} 324 nm; $^1\text{H-NMR}$ (CDCl_3) δ (ppm) 8.22 (s, 1 H, H-6), 6.30 (t, $J = 6.55$ Hz, 1 H, H-1'), 6.25 (s, 1 H, $\text{HC}=\text{C}(\text{O})\text{CH}_2$), 5.20 (m, 1 H, H-3'), 4.40 (m, 3 H, H-4', 5'), 2.92 (m, 3H, H-2', $\text{HC}=\text{C}(\text{O})\text{CH}_2\text{CH}_2$), 2.43 (t, 2 H, H- $\text{CH}_2\text{CH}_2\text{CN}$), 2.05- 2.10 (m, 9 H, H-2', $2\times\text{CH}_3$, $\text{CH}_2\text{CH}_2\text{CH}_2$)

6-Butyronitrile-3-(2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3- α]pyrimidin-2-one (2.5)

To 2 M KOH solution (1.6 mL) was added a solution of **(2.4)** (0.61 g, 1.5 mmol) in methanol (10 mL) and the mixture stirred for 4 minutes. TLC (20% methanol/chloroform) showed the reaction had gone completion. After neutralization with 1 N HCl the solvents were removed under reduced pressure. The resulting residue was dissolved in methanol and any remaining insoluble salt filtered out. Removal of the solvent provided crude **(2.5)** (0.48 g, 97%) UV (MeOH) λ_{\max} 324 nm; $^1\text{H-NMR}$ (d_6 -DMSO) δ (ppm) 8.75 (s, 1 H, H-6), 6.57 (s, 1 H, H- $\text{CH}=\text{C}(\text{O})\text{CH}_2$), 6.30 (t, $J = 6.55$ Hz, 1 H, H-1'), 5.33 (m, 1 H, exchangeable, H-OH), 5.18 (m, 1 H, H-OH), 4.23 (m, 1 H, H-3'), 3.92 (m, 1 H, H-4'), 3.68 (m, 2 H, H-5'), 2.80 (t, $J =$, 2 H, H- $\text{CH}=\text{C}(\text{O})\text{CH}_2\text{CH}_2$), 2.60 (t, 2 H, H- $\text{CH}_2\text{CH}_2\text{CN}$), 2.40 (m, 2 H, H-2'), 2.05 (m, 1 H, H-2'), 1.92 (m, 2 H, H- $\text{CH}_2\text{CH}_2\text{CH}_2\text{CN}$)

2,2,2-Trifluoro-N-(3-(2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3- α]pyrimidin-2-one-6-Butyl)-acetamide (2.6)

A solution of **(2.5)** (0.1 g, 0.32 mmol) in methanol (15 mL) and Raney-Ni hydrogenation catalyst (1 g) were loaded into a Parr apparatus and stirred under hydrogen ($p=25$ psi) for 4 hours. TLC (20 % methanol/chloroform) shows reaction completion. The reaction mixture was filtered through Celite. To the filtrate was then added ethyl

- 28 -

trifluoroacetate (1 mL) and triethylamine (0.5 mL) and the mixture left to stir for 4 hours. Solvent evaporation and chromatography (15-20% methanol/chloroform) afforded **(2.6)** (81 mg, 60%) UV (MeOH) λ_{\max} 324 nm; $^1\text{H-NMR}$ (d_6 -DMSO) δ (ppm) 9.40 (bs, 1 H, exchangeable, H-NHCOCF₃)
s 8.75 (s, 1 H, H-6), 6.47 (s, 1 H, H-CH=C(O)CH₂), 6.18 (t, J = 6.55 Hz, 1 H, H-1'), 5.33 (m, 1 H, exchangeable, H-OH), 5.18 (m, 1 H, H-OH), 4.23 (m, 1 H, H-3'), 3.92 (m, 1 H, H-4'), 3.68 (m, 2 H, H-5'), , 3.20 (m, 2 H, H-CH₂CH₂NH), 2.62 (t, J= , 2 H, H-CH=C-O-CH₂CH₂), 2.40 (m, 2 H, H-2'_b), 2.05 (m, 1 H, H-2'_a), 1.60-1.80 (m, 4 H, H-CH₂CH₂CH₂CH₂NH)

10

Example 3

Synthesis of 6-methylamine-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-*d*]pyrimidin-2-one (3.3a) and 5-Carboxyfluoresceinyl -(6-methylamine-3-(5-triphosphate-2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-*d*]pyrimidin-2-one) (3.3b)

2,2,2-Trifluoro-N-(3-(2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-*d*]pyrimidin-2-one-6-methyl)-acetamide (3.1a)

Triethylamine (3.04 g, 4.2 mL, 30 mmol, 1.5 eq) was added to a stirred solution of 5-iodo-2'-deoxyuridine (7.1 g, 20 mmol, 1 eq), Pd[P(C₆H₅)₃]₄ (1.16 g, 1 mmol, 0.05 eq), CuI (0.38 g, 2 mmol, 0.1 eq) and

- 30 -

2,2,2-trifluoro-N-propargyl-acetamide (4.53 g, 30 mmol, 1.5 eq) in dry DMF (75 mL) and the resulting reaction mixture was then stirred for two days at 55 °C under inert atmosphere. Isolation and purification of the product as described for the preparation of (2.4), yielded (3.1a) (4.2 g, 56%) UV

5 (MeOH) λ_{\max} 324 nm; $^1\text{H-NMR}$ (d_6 -DMSO) δ (ppm) 10.07 (s, 1 H, exchangeable, H-NH-COCF₃), 8.78 (s, 1 H, H-6), 6.63 (s, 1 H, H-CH=C(O)CH₂), 6.18 (t, J = 6.55 Hz, 1 H, H-1'), 5.00-5.3 (bm, 2H, exchangeable, 2xOH), 4.48 (m, 2 H, H-CH₂-NH), 4.23 (m, 1 H, H-4'), 3.95 (m, 1 H, H-3'), 3.63 (m, 2 H, H-5'), 2.40 (m, 1 H, H-2'_b), 2.07 (m, 1 H, H-2'_a)

10

2,2,2-Trifluoro-N-(3-(2-deoxy- β -D-erythro-pentofuranosyl)furano[2,3-d]pyrimidin-2-one-6-methyl)-acetamide (3.1b)

Triethylamine (0.46 g, 0.63 mL, 4.5 mmol, 1.5 eq) was added to a stirred solution of (2.1b) (1.11 g, 3 mmol, 1 eq), Pd[P(C₆H₅)₃]₄ (0.35 g, 0.3 mmol, 0.1 eq), CuI (0.12 g, 0.6 mmol, 0.2 eq) and 2,2,2-trifluoro-N-propargyl-acetamide (0.55 g, 3.6 mmol, 1.2 eq) in dry DMF (25 mL) and the resultant reaction mixture was then stirred for two days at 55 °C under an inert atmosphere. Isolation and purification of the product as described for the preparation of (2.4), yielded (3.1b) (0.62 g, 53%): UV (MeOH) λ_{\max}

20 324 nm; $^1\text{H-NMR}$ (d_6 -DMSO) δ (ppm) 10.08 (s, 1 H, exchangeable, H-NH-COCF₃), 8.90 (s, 1 H, H-6), 6.63 (s, 1 H, H-CH=C(O)CH₂), 5.87 (d, J = 6 Hz, 1 H, H-1'), 5.58 (m, 1 H, exchangeable, H-OH), 5.25 (m, 1 H, exchangeable, H-OH), 5.00 (m, 1 H, exchangeable, H-OH), 4.48 (m, 2 H, H-CH₂-NH), 4.00 (m, 3 H, H-4', 3', 2'), 3.86 (m, 1H, H-5'_b), 3.68 (m, 1 H,

25 H-5'_a)

2,2,2-Trifluoro-N-(3-(5-triphospho-2-deoxy- β -D-erythro-pentofuranosyl)furano[2,3-*d*]pyrimidin-2-one-6-methyl)-acetamide (3.2)

5 The nucleoside (3.1a) (1g, 2.7 mmol, 1 eq) was dissolved in triethylphosphate (50 mL) and the solution cooled to 0 °C. Phosphorus oxychloride (0.163 g, 0.37 mL, 4 mmol) was added dropwise and the reaction mixture stirred at 0 °C under inert atmosphere for three hours. TLC on silica gel (*i*-Pr-OH/NH₄OH/H₂O-6/3/1) showed reaction completion
10 to the monophosphate stage. Tributylamine (2.5 g, 3.25 mL, 13.5 mmol, 5 eq) and di-tributylammonium pyrophosphate 0.5M solution in dry DMF (27 mL, 13.5 mmol, 5 eq) were simultaneously added at 0 °C. The resulting reaction mixture was stirred at 0 °C for five minutes then ten minutes at room temperature before quenching with 1 M triethylamine bicarbonate
15 (TEAB) buffer (100 mL) and leaving to stir overnight at room temperature. After solvent removal, the reaction mixture was dissolved in water and applied to a SEPHADEX resin (1 L column). Elution with 4L TEAB buffer in gradient mode from 0.05 M TEAB to 1 M TEAB afforded (3.2). The product was further purified on HPLC using a reverse phase C18 column using
20 0.1mTEAB and 25%MeCN in 0.1M TEAB as eluants over a 30min gradient (0.3 g, 14%): UV (H₂O) λ_{max} 324 nm; ³¹P-NMR (D₂O) δ (ppm) -6.00 (d, J = 21.06 Hz), -12.50 (d, J = 19.53 Hz), -22.2 (t, J = 20.45 Hz)

6-Methylamine-3-(5-triphospho-2-deoxy- β -D-erythro-pentofuranosyl)furano[2,3-*d*]pyrimidin-2-one) (3.3a)

25 Hydrolysis of (3.2) (10.9 mg, 3 mL sol 4.423 mM in water) with 2.5 M sodium carbonate buffer (3 mL) at room temperature for three hours and purification of the crude product on HPLC using a C18 column and the same gradient system as above, afforded (3.3a) (5.9 mg, 82%):

- 32 -

UV (H₂O) λ_{\max} 324 nm; ³¹P-NMR (D₂O) δ (ppm) -4.00 (d, J = 21.06 Hz), -10.20 (d, J = 19.53 Hz), -19.50 (t, J = 20.45 Hz)

5 **5-Carboxyfluoresceinyl-(6-methylamine-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-*d*]pyrimidin-2-one) (3.3b)**

5-Carboxyfluorescein-N-hydroxysuccinimide ester (FAM-NHS ester) (1.7 mg, 1.25 eq) dissolved in 0.5 mL dry DMF was added to (3.2) (0.84 mg, 14.8 mM, 1 eq) dissolved in 0.25 M sodium carbonate/sodium bicarbonate buffer (1 mL) at pH=8.5 and the resulting mixture stirred at
10 room temperature for three hours. TLC on silica gel (*i*-Pr-OH/NH₄OH/H₂O-6/3/1) showed reaction completion. Purification on a short plug of a silicagel column followed by reverse phase HPLC on C18 column afforded (3.3b). UV (H₂O) λ_{\max} 324 nm 493 nm

15

Example 4

Synthesis of 6-methyl-N-(6-amino)-caproamide-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-*d*]pyrimidin-2-one (4.3a) and 5-FAM-(6-methyl-N-(6-amino)-caproamide-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-*d*]pyrimidin-2-one)
20 (4.3b).

- 33 -

2,2,2-Trifluoro-(6-methyl-N-(6-amino)-caproamide-3-(2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-*d*]pyrimidin-2-one)-acetamide (4.1)

Treatment of (3.1a) (0.37 g, 1 mmol, 1 eq) with 2.5 M sodium carbonate buffer (10 mL) for three hours followed by addition of 2,2,2-Trifluoro-N-(6-amino-N-Hydroxysuccinimide caproate)-acetamide (0.48 g, 1.5 mmol, 1.5 eq) dissolved in 3 mL of dry DMF, afforded after chromatography on silicagel (15% methanol/chloroform as eluent) the desired compound (4.1) (0.27 g, 55%): UV (MeOH) λ_{\max} 324 nm; $^1\text{H-NMR}$ (d_6 -DMSO) δ (ppm) 9.37 (bs, 1 H, exchangeable, H-NH-COCF₃), 8.74 (s, 1 H, H-6), 8.33 (s, 1 H, exchangeable, H-CH₂NH-COCH₂), 6.50 (s, 1 H, H-CH=C(O)CH₂), 6.12 (t, J = 6.45 Hz, 1H, H-1'), 5.27 (m, 1 H, exchangeable, H-OH), 5.11 (m, 1 H, exchangeable, H-OH), 4.21 (m, 3 H, H-3', OCCH₂NHCO), 3.88 (m, 1 H, H-4'), 3.65 (m, 2 H, H-5'), 3.16 (m, 2 H, H-CH₂NHCOCF₃), 2.35 (m, 1 H, H-2'_b), 2.15 (t, J = 7.27 Hz, 2 H, H-CH₂CONH), 2.00 (m, 1 H, H-2'_a), 1.5 (m, 4 H, H-CH₂CH₂CH₂CH₂CH₂), 1.26 (m, 2 H, H-CH₂CH₂CH₂CH₂CH₂)

2,2,2-Trifluoro-N-(6-methyl-N-(6-amino)-caproamide-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-*d*]pyrimidin-2-one)-acetamide (4.2)

This compound was prepared from (4.1) (0.169 g, 0.35 mmol, 1 eq) in a similar manner as (3.2) to afford (4.2) (70 mg, 22%): UV (H₂O) λ_{\max} 324 nm; $^{31}\text{P-NMR}$ (D₂O) δ (ppm) -4.00 (d, J = 21.06 Hz), -10.20 (d, J = 19.53 Hz), -19.50 (t, J = 20.45 Hz)

25

6-Methyl-N-(6-amino)-caproamide-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-*d*]pyrimidin-2-one (4.3a)

This compound was prepared from (4.2a) (20 mg, 21.5 μM , 1 eq) in a similar manner as (3.3a) to afford (4.3a) (15 mg, 84%): UV (H₂O)

- 35 -

λ_{\max} 324 nm; ^{31}P -NMR (D_2O) δ (ppm) -4.00 (d, J = 21.06 Hz), -10.20 (d, J = 19.53 Hz), -19.50 (t, J = 20.45 Hz)

5 **5-FAM-(6-methyl-N-(6-amino)-caproamide-3-(5-triphospho-2-deoxy- β -D-erythro-pentofuranosyl)furano[2,3-d]pyrimidin-2-one) (4.3b)**

This compound was prepared from (4.2) (1.7 mg, 20.3 mM, 1 eq) in a similar manner as (3.3b) to afford (4.3b) (0.91 mM, 5%): UV (H_2O) λ_{\max} 324 nm 493.8 nm

10 **Example 5**

Synthesis of 2,2,2-Trifluoro-N-(3-(2-deoxy- β -D-erythro-pentofuranosyl)furano-pyrimidin-2-one-6-methyl)-acetamide (5.1)

6-methyl-N-(6-amino)-caproamide-3-(5-triphospho-2-deoxy-β-D-*erythro*-pentofuranosyl)pyrrolo[2,3-*d*]pyrimidin-2-one (10.1a)

15 This compound was prepared from (4.2) (30 mg, 35.8 mM, 1 eq) in a similar manner as (8.1a) to afford (10.1a) (20 mg, 24.3 mM, 68%):
UV (H₂O) λ_{max} 335 nm

20 5-FAM-(6-methyl-N-(6-amino)-caproamide-3-(5-triphospho-2-deoxy-β-D-*erythro*-pentofuranosyl)pyrrolo[2,3-*d*]pyrimidin-2-one) (10.1b)

This compound was prepared from (10.1a) (6.5 mg, 7.8 mM, 1 eq) in a similar manner as (8.1b) to afford (10.1b) (1.88 mM, 24%): UV (H₂O) λ_{\max} 335 nm 494 nm

5 **Cy5-(6-methyl-N-(6-amino)-caproamide-3-(triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)pyrrolo[2,3-d]pyrimidin-2-one (10.1c)**

This compound was prepared from (10.1a) in a similar manner as (8.1b) to afford (10.1c): UV (H₂O) λ_{\max} 355 nm, 648 nm

10 **Example 11**

1-(2'-deoxy-5'-triphospho- β -D-ribofuranosyl)piperidino[2,3-d]pyrimidine-2(1H)-one (1.6), 6-methylamine-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-d]pyrimidin-2-one) (3.3a) and 5-FAM-(6-methylamine-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-d]pyrimidin-2-one) (3.3b), 6-methyl-N-(6-amino)-caproamide-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-d]pyrimidin-2-one (4.3a) and 5-FAM-(6-methyl-N-(6-amino)-caproamide-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)furano[2,3-d]pyrimidin-2-one) (4.3b), 6-methylamine-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)pyrrolo[2,3-d]pyrimidin-2-one) (8.1), 6-methyl-N-(6-amino)-caproamide-3-(5-triphospho-2-deoxy- β -D-*erythro*-pentofuranosyl)pyrrolo[2,3-d]pyrimidin-2-one (10.1a), and the FAM and Cy5 of (10.1a, e.g. 10.1b and 10.1c) as substrates for terminal deoxynucleotidyl transferase. In order to test the ability of compounds (1.6), (3.3a), (3.3b), (4.3a), (4.3b), (8.1), (10.1a), (10.1b) and (10.1c) to be accepted by terminal deoxynucleotidyl transferase as a substrate, an oligonucleotide tailing reaction was performed.

A 15mer primer (sequence: 5' TGC ATG TGC TGG AGA 3') and 8 to 32 base oligonucleotide markers were 5' end labelled with [γ 32 P] ATP and T4 polynucleotide kinase. Reactions were boiled for 5 minutes after labelling to remove any PNK activity. Four picomoles of the labelled primer, 25 U
5 terminal deoxynucleotidyl transferase and 32 μ M dATP, dCTP, dGTP, dTTP or compounds (1.6), (3.3a), (3.3b), (4.3a), (4.3b), (8.1), (10.1a), (10.1b) and (10.1c) were incubated in 25 μ l 100mM cacodylate buffer pH7.2, 2mM CoCl₂ and 0.2mM 2-mercaptoethanol for 90 minutes at 37°C. The reactions were stopped by the addition of formamide stop solution and
10 the reaction products run on a 19% polyacrylamide 7M urea gel with the labelled markers. Autoradiography using Biomax film was carried out on the dry gel.

The results showed that the natural nucleotides gave 3' tails in the region
15 of 50 to 120 bases. The order of tail size being dTTP, dATP, dCTP then dGTP. Compound (1.6) gave 3' tails equivalent to those produced by dCTP at the same concentration. Compound (10.1a) gave a tail of ~7-8 bases. Compound (10.1b) gave tails in the 18-24 base range. Compound (10.1c) gave tails greater than 30 bases in length, which is surprising
20 compared to the tails produced in the presence of fluor labelled natural dNTP's. Compound (8.1) produced a tail 2-3 bases in length. Compound (3.3a) gave a tail 2-3 bases in length. Compound (3.3b) produced a tail 2-3 bases in length. Compound (4.3a) gave a tail 7-9 bases in length. Compound (4.3b) gave a tail 9-14 bases in length. This shows that the
25 compounds of the invention are all substrates for terminal deoxynucleotidyl transferase and can therefore be incorporated into nucleic acids as a means of labelling or adding a new highly reactive functional group.

Example 12**Primer extension assays to study incorporation of nucleotides (10.1a), (10.1b) and (10.1c) by DNA polymerases**

A primer extension assay was used to evaluate compounds (10.1a),
5 (10.1b) and (10.1c) as substrates for exonuclease free Klenow fragment of DNA polymerase I (EFK). The assay used a ³³P 5' end labelled 15mer primer hybridised to a 24mer template. The sequences of the primer and template are:

10 Primer 5' TGCATGTGCTGGAGA 3'
Template 3' ACGTACACGACCTCTGCCTTGCTA 5'

One picomole ³³P labelled primer was hybridised to 2 picomoles of template in x2 Klenow buffer. To this was added either 20μM dCTP or
15 20μM (10.1a) or 20μM (10.1b) or 20μM (10.1c) or mixtures of dCTP and compound (10.1a) or compound (10.1b) or compound (10.1c) keeping the total nucleotide concentration fixed at 20μM. One unit EFK and 2mU inorganic pyrophosphatase were used per reaction. Primer alone, primer plus template plus enzyme controls were also carried out. The reactions
20 were incubated at 37°C for 3 minutes. Reactions were then stopped by the addition of formamide / EDTA stop solution. Reaction products were separated on a 19% polyacrylamide 7M urea gel and the product fragments sized by comparison with a ³³P labelled 8 to 32 base oligonucleotide ladder after exposure to Kodak Biomax autoradiography
25 film.

The autoradiogram showed that all three compounds were substrates for the polymerase being incorporated in place of dCTP. Compound (10.1a) was a surprisingly good substrate compared to the results obtained with similarly functionalised dCTP analogues like 5-
30 allylaminocaproamido dCTP. This result shows that the analogues of this

invention are useful in labelling DNA and also in introducing a highly reactive functionality into the DNA which would not normally be present.

Example 13

5 **Primer extension assays to study incorporation of compounds (3.3a), (3.3b), (4.3a),(4.3b) and (8.1) by DNA polymerases**

A primer extension assay was used to evaluate compounds (3.3a), (3.3b), (4.3a),(4.3b) and (8.1) as substrates for exonuclease free Klenow fragment of DNA polymerase I (EFK). The assay used a ³³P 5' end labelled 15mer
10 primer hybridised to one of two 24mer templates. The sequences of the primer and templates are:

Primer 5' TGCATGTGCTGGAGA 3'

Template 1 3' ACGTACACGACCTCTACCTTGCTA 5'

15 Template 2 3' ACGTACACGACCTCTGAACTAGTC 5'

One picomole ³³P labelled primer was hybridised to 2 picomoles of template in x2 Klenow buffer. To this was added either 20µM dCTP or 20µM (3.3a) or 20µM (3.3b) or 20µM (4.3a) or 20µM (4.3b) or
20 20µM (8.1) or mixtures of dCTP and compound (3.3a) or (3.3b) or (4.3a) or (4.3b) or (8.1) keeping the total nucleotide concentration fixed at 20µM . One unit EFK and 2mU inorganic pyrophosphatase were used per reaction. Primer alone, primer plus template plus enzyme controls were also carried out. The reactions were incubated at 37°C for 3 minutes.
25 Reactions were then stopped by the addition of formamide / EDTA stop solution. Reaction products were separated on a 19% polyacrylamide 7M urea gel and the product fragments sized by comparison with a ³³P labelled 8 to 32 base oligonucleotide ladder after exposure to Kodak Biomax autoradiography film.

The autoradiograms showed that compound (4.3b) was only incorporated in reactions using Template 2, thus indicating its preference for replacing dCTP. Compound (3.3b) was not a substrate for the polymerase using either of the Templates.

5 Compound (8.1) was a substrate for the polymerase being able to substitute for dCTP. Again this is very surprising as 5-allylaminocaproamide dCTP did not show any incorporation under similar assay conditions.

 Compound (4.3a) was also a substrate for the polymerase
10 again being able to replace dCTP. However, compound (3.3a) was not a substrate for the polymerase. This highlights the surprising nature of the results obtained with compounds (4.3a), (8.1) and (10.1a). In each case the analogue with the longer linker arm is the better substrate for the polymerase i.e. (10.1a) is a better substrate than (8.1), (4.3a) is a better
15 substrate than (3.3a), which in fact is not a substrate for the polymerase under the conditions tested.

Example 14

 Primer extension assays to study 1-(2'-deoxy-5'-triphospho-β-D-ribofuranosyl)piperidino[2,3-d]pyrimidine-2(1H)-one (1.6) incorporation
20 by DNA polymerases

 A primer extension assay was used to evaluate compound (1.6) as a substrate for exonuclease free Klenow fragment of DNA polymerase I (EFK). The assay used a ³³P 5' end labelled 15mer primer
25 hybridised to a 24mer template. The sequences of the primer and template are:

Primer	5' TGCATGTGCTGGAGA 3'
Template	3' <u>ACGTACACGACCTCTGA</u> ACTAGTC 5'

One picomole ^{33}P labelled primer was hybridised to 2 picomoles of template in x2 Klenow buffer. To this was added either $4\mu\text{M}$ dNTP αS or $80\mu\text{M}$ (1.6) or a mixture of $4\mu\text{M}$ dNTP αS $80\mu\text{M}$ (1.6). One unit EFK and 2mU inorganic pyrophosphatase were used per reaction. Primer
5 alone, primer plus template plus enzyme controls were also carried out. The reactions were incubated at 37°C for 3 minutes. Reactions were then stopped by the addition of formamide / EDTA stop solution. Reaction products were separated on a 19% polyacrylamide 7M urea gel and the product fragments sized by comparison with a ^{33}P labelled 8 to 32 base
10 oligonucleotide ladder after exposure to Kodak Biomax autoradiography film.

This showed that (1.6) was a substrate for EFK and that it was efficiently incorporated in place of dCTP.

15 **Example 15**

Incorporation of Compound (10.1a) into cDNA and PCR products

1st Strand cDNA Synthesis

20 Incorporation of compound (10.1a) into 1st strand cDNA was carried out using a balance of dCTP such that the total concentration of (10.1a) and dCTP was equivalent to each of the other three dNTP concentrations.

25 (10.1a) was used at three different percentages:

- 1) 50% (10.1a)
- 2) 75% (10.1a)
- 3) 100% (10.1a)

- 47 -

Nucleotide Solutions

	(10.1a) level	50%	75%	100%
	10mM dATP	1 μ l	1 μ l	1 μ l
	10mM dGTP	1 μ l	1 μ l	1 μ l
5	10mM dTTP	1 μ l	1 μ l	1 μ l
	5mM dCTP	1 μ l	0.5 μ l	0 μ l
	5mM (10.1a)	1 μ l	1.5 μ l	2 μ l

These reactions were compared with reactions including Cy5 labelled
 10 dCTP. All reactions were monitored by carrying out the reaction in
 duplicate and monitoring one of the duplicates with a spike of ^{33}P -dATP.

Reaction Matrix

Sample

15	1	50% (10.1a)
	2	50% (10.1a) + ^{33}P -dATP
	3	75% (10.1a)
	4	75% (10.1a) + ^{33}P -dATP
	5	100% (10.1a)
20	6	100% (10.1a) + ^{33}P -dATP
	7	Cy5 dCTP
	8	Cy5 dCTP + ^{33}P -dATP

1st strand cDNA synthesis

25 To a reaction tube add:

1 μ g mRNA

1 μ l anchored dT₍₂₅₎ primer

10 μ l water

Heat at 70°C for 5 minutes

30 Incubate at room temp. for 10 minutes

- 48 -

Transfer tube to ice and add:

4 μ l buffer

1 μ l NaPPi

1 μ l HPRI

5 1 μ l dNTP mix (50%, 75% or 100% (10.1a)) or Cy5 dCTP

1 μ l ³³P-dATP- active samples only

1 μ l AMV reverse transcriptase 20U/ μ l

Incubate at 42°C for 2 ½ hours

Store on ice

10

Alkaline Hydrolysis

Heat reactions at 94°C for 3 minutes

Add 1 μ l of 5M NaOH

Incubate at 37°C for 10 minutes

15 Add 1 μ l of 5M HCl

Add 5 μ l of 1M Tris.HCl, pH 6.8

Mix and centrifuge briefly.

The cDNA reactions were monitored by TLC as follows:

20

1 μ l of sample was spotted onto PEI cellulose TLC plates and run in 1.25M Potassium phosphate buffer

TLC results

25	(10.1a)	³³ P-dATP Incorporation
	50%	23.2%
	75%	16.5%
	100%	11.5%
	Standard cDNA	15.9%

30

Samples were then purified by Qiagen column and eluted in 50µl of water.

The active cDNA products were analysed on a 6% polyacrylamide gel

8µl of sample + 3µl of loading dye

Run at 35mV for 1 ½ hours

- 5 The gel was then covered in Saran wrap and exposed to phosphorscreen for 1 hour. Phosphorscreen analysis was carried out on the Molecular Dynamics Storm 860 instrument.

Results

- 10 6% polyacrylamide gel analysis showed that cDNA products had been made in all reactions.

PCR Reactions

Incorporation of (10.1a) into arabidopsis DNA by PCR was carried out as

- 15 follows:

The (10.1a) was used in the PCR at various percentages with a balance of dCTP such that the total concentration of (10.1a) and dCTP was equivalent to each of the other three base dNTP's. The percentages of (10.1a) used

- 20 were:

	%(10.1a)
	0%
	5%
25	10%
	20%
	30%
	40%
	50%
30	100%

Compound (10.1a) PCR conditions

To each reaction tube was added:

- 50 -

	<i>Arabidopsis thaliana</i> template DNA (100 pg/ μ l)	5 μ l
	10X PCR reaction buffer	5 μ l
	T7 forward primer (5 μ M)	5 μ l
5	T3 reverse primer (5 μ M)	5 μ l
	dATP (4 mM)	2.5 μ l
	X% (10.1a) (4 mM)	2.5 μ l
	dGTP (4 mM)	2.5 μ l
	dTTP (4 mM)	2.5 μ l
10	<i>Thermus aquaticus</i> DNA polymerase (5 units/ μ l)	0.5 μ l
	water	<u>19.5 μl</u>
	Total	50 μ l

The reaction mix was covered with two to three drops of mineral .

15 The reaction tubes were placed in the PCR thermocycling block.

PCR thermocycling:- carried out in a Perkin Elmer DNA Thermal Cycler 480

35 cycles of

20

94°C	45 seconds
45°C	45 seconds
72°C	2 minutes

Followed by

72°C	8 minutes
4°C	soak

25

After PCR, the samples were purified by Qiagen column and analysed by 1% agarose gel.

10 μ l sample + 1 μ l Vistra green

Run at 150V for 1 ½ hours

Results

Agarose gel analysis showed that all levels of **(10.1a)** resulted in the formation of PCR product **EXCEPT** for the 100% **(10.1a)** level.

5 Attachment of Cy5 NHS-Ester to **(10.1a)** incorporated into cDNA and PCR product

Cy5 NHS-Ester was coupled to **(10.1a)** bases incorporated into DNA by the above methods as follows:

10

Cy5 NHS-Ester (Amersham Pharmacia Biotech)

Q15108 Lot: 973181

1 vial dissolved in 1ml of dry DMF

15

Labelling reaction

20µl DNA

5µl Cy5 NHS-Ester

25µl sodium bicarbonate buffer, pH 9.3

20

50µl Total volume

Labelling Matrix

	Tube	%(10.1a)	Inc. Method
	1 + 2	0	PCR
25	3 + 4	5	PCR
	5 + 6	10	PCR
	7 + 8	20	PCR
	9 + 10	30	PCR
	11 + 12	40	PCR
30	<u>13 + 14</u>	<u>50</u>	<u>PCR</u>

- 52 -

15 + 16	75	cDNA
17 + 18	100	cDNA
19 + 20	M13- standard DNA to check for non-specific labelling	

- 5 The dye was allowed to react with the (10.1a) groups in the DNA for 16 hours (overnight)

The following day, 2µl of one of each duplicate was analysed on silica gel TLC.

- 10 TLC system

Silica gel- normal phase, 740238909 (Merck)

Solvent - 60% IPA (iso propyl alcohol)

20% NH₄OH

20% Water

15

The samples were spotted and run for 1 hour.

The TLC sheet was then dried and analysed on the Molecular Dynamics Storm 860 instrument.

- 20 **Cy5 NHS-Ester labelling results**

The scan showed evidence of Cy5 labelling in tubes 1-18, but not tubes 19-20, indicating that the NHS-Ester has coupled with the (10.1a) groups incorporated into the DNA. Increasing Cy5 labelling was seen with increasing percentage of compound (10.1a) in the reaction.

- 25 This clearly shows the ability of this analogue to introduce functionality into the DNA. This functionality could be used for labelling as above or for attachment to a solid support.

30

CLAIMS

1. A compound having the structure

where X = O or NH or S

Y = N or CHR⁶ or CR⁶ or CO

10 W = N or NR⁶ or CHR⁶ or CR⁶ or S or CO

n = 1 or 2 or 3

each R⁶ is independently H or O or alkyl or alkenyl or alkoxy
or aryl or a reporter moiety,

15 where necessary (i.e. when Y and/or W is N or CR⁶) a double
bond is present between Y and W or W and W, and

Q is H or a sugar or a sugar analogue or a nucleic acid
backbone or backbone analogue,

provided that

- 20 i) when n is 2 and X is NH and W is CHR⁶ or CR⁶, and Y is CO,
then at least one reporter moiety is present,
- ii) when n is 1 and X is NH and W is N or NR⁶, then at least one
reporter moiety is present,
- 25 iii) when n is 1 and X is O and Y is CHR⁶ or CR⁶ and W is CHR⁶
or CR⁶, then at least one R⁶ is a reporter moiety which is a reactive group
or signal moiety or solid surface joined to the remainder of the molecule by
a linker of at least 3 chain atoms,

- iv) when n is 1 and X is NH and Y is CHR^6 or CR^6 and W is CHR^6 or CR^6 , then at least one reporter moiety is present,
 - v) when W is S , then n is 2 and W_n is $-\text{CHR}^6\text{-S-}$ or $=\text{CR}^6\text{-S-}$,
 - vi) when n is 2 and X is NH and Y is CHR^6 or CR^6 , then at least
- 5 one R^6 is a reporter moiety which is a reactive group or signal moiety or solid surface joined to the remainder of the molecule by a linker of at least 3 chain atoms.

- 55 -

2. A compound as claimed in claim 1, which is a) a nucleoside or nucleoside analogue wherein Q is

5

where Z is O, S, Se, SO, NR^9 or CH_2 ,

R^1 , R^2 , R^3 and R^4 are the same or different and each is H, OH, F, NH_2 , N_3 , O-hydrocarbyl or a reporter moiety,

R^5 is OH, SH or NH_2 or mono-, di- or tri-phosphate or -

10 thiophosphate, or corresponding boranophosphate,

or one of R^2 and R^5 is a phosphoramidite or other group for incorporation in a polynucleotide chain, or a reporter moiety,

or Q consists of one of the following modified sugar

structures

15

Acyclic Sugars

$\text{R} = \text{CH}_3, \text{CH}_2\text{OH}, \text{H},$

20

- 56 -

Morpholino Backbone

- or b) a polynucleotide wherein Q is a nucleic acid backbone
- 5 consisting of sugar-phosphate repeats or modified sugar-phosphate repeats (LNA), or a backbone analogue such as peptide or polyamide nucleic acid (PNA).
3. A compound as claimed in claim 1 or claim 2 wherein the structure is

(1)

(2)

(3)

(4)

4. A compound as claimed in any one of claims 1 to 3, wherein a reporter moiety is present.
5. A compound as claimed in claim 4, wherein the reporter moiety is a signal moiety.
- 5 6. A compound as claimed in claim 4 or claim 5, wherein the reporter moiety is a reactive group or signal moiety or solid surface joined to the remainder of the molecule by a linker of at least 3 chain atoms.
7. A compound as claimed in any one of claims 1 to 6, wherein R^5 is triphosphate.
- 10 8. A compound as claimed in any one of claims 1 to 6, wherein one of R^2 and R^5 is selected from phosphoramidite and H-phosphonate.
9. A polynucleotide comprising at least one residue of a nucleotide analogue according to any one of claims 1 to 8.
10. A polynucleotide as claimed in claim 9 which is DNA or RNA.
- 15 11. A chain extension method which comprises reacting a polynucleotide with a nucleoside triphosphate analogue according to any one of claims 1 to 8 in the presence of a polymerase or a terminal deoxynucleotidyl transferase enzyme.
12. A method of detecting the polynucleotide according to claim 9
20 or claim 10, which method comprises using for detection an antibody which binds to the base of the nucleoside analogue residue.
13. A method of making cDNA which comprises incubating an RNA template with a monomer mixture including a nucleotide analogue as claimed in any one of claims 1 to 8 in the presence of a reverse
25 transcriptase.
14. A method of amplifying a polynucleotide by PCR which method comprises using a monomer mixture including a nucleotide analogue as claimed in any one of claims 1 to 8.

15. Use of a compound according to any one of claims 1 to 8, in a nucleic acid sequencing method to reduce compression artefacts.
16. Use of a compound according to any one of claims 1 to 8, as a label for analysis by mass spectrometry.
- 5 17. Use of a compound according to any one of claims 1 to 8, as an anti-viral agent.
